

Déjà Vu X COM+ Server Installation:

In order to install Déjà Vu X COM+ Server you should follow these steps:

- On Windows Server 2003 and 2003 R2, enable the option *Enable network COM+ Access* in *Control Panel > Add or Remove programs > Add/Remove Windows Components > Application Server*.
- On Windows Server 2008 and 2008 R2, go to *Control Panel > Programs and Features > Turn Windows features on or off*, and in the *Server Manager* window that appears, make sure that the *Application Server* role is installed and that its *COM+ Network Access* role service is installed.
- Create and share a new folder to store the Translation Memories and Termbases. The shared folder should have the following share and security permissions:
 - o Share (in the "Share" tab of the folder properties):
 - Select the name of the Windows/Active Directory user group that corresponds to the translators (e.g. DvelopTranslators), and give this group "Full control" access rights. This group should be created on the domain controller and should contain all the users that need access to the shared folder. If no such group exists, then select "Everyone" security principal and give it "Full control" access rights.
 - Give the Network Service account (on the local server – not a domain account) "Full control" access rights.
 - o Security (in the "Security" tab of the folder properties):
 - Select the name of the Windows/Active Directory user group that corresponds to the translators (e.g. DvelopTranslators), and give this group "Full control" access rights. This group should be created on the domain controller and should contain all the users that need access to the shared folder. If no such group exists, then select "Everyone" security principal and give it "Full control" access rights.
 - Give the Network Service account (on the local server – not a domain account) "Full control" access rights.
- Install the Déjà Vu X COM+ Server component. The Déjà Vu X COM+ Server can be installed from the CD-ROM that came with your copy of Déjà Vu X.
- Set the COM+ permissions on the server so that clients can access the shared databases using the Déjà Vu X COM+ Server application:
 - o Go to *Administrative Tools > Component Services* and then to *Console Root > Component Services > Computers*, right click on *My Computer* and select the *Properties* menu option. Go to the *COM Security* tab and add the following permissions under *Launch and activation permissions > Edit Limits*:
 - For the translator user group (e.g. DvelopTranslators): *Remote activation*, *Remote launch* (use the built-in *Everyone* account if this group does not exist).

Client installation:

- Set permissions in each client computer so the server can call-back the Déjà Vu 2 Workgroup clients:
 - o Go to *Administrative tools > Component services*, and then to *Console Root > Component Services > Computers*, right click on *My Computer* and select the *Properties* menu option. Go to the *COM Security* tab and add the following permissions under *Access Permissions > Edit Default*:
 - For the server (specify the machine name of the server where the Déjà Vu 2 COM+ Server is installed, e.g. MYDVXSERVER\$): *Remote access*. (When specifying the account for which to set the permissions, you may need to click on *Object Types* and check the *Computers* entry in order to be able to enter a machine name.)

Now the client computers should be able to work with Déjà Vu X Workgroup sharing Translation Memories and Termbases (not projects) using the Déjà Vu X COM+ Server component installed on the server.
